Locomotive Fuelling Problem (LFP) in Railroad Operations

Bodhibrata Nag¹ & Katta G.Murty²

About 75% of the world's railroads operate with diesel fuel. Even though European railroads rely on electric traction to a large extent, US railroads rely mostly on diesel fuel (100% of US freight is hauled by diesel locomotives). Like in other industries there is intense competition to keep costs low; and in railroad operations based on diesel locomotives, the cost of fuel and its delivery is the major component of the overall cost. Since the cost of fuel is highly location dependent (due to local taxes and transportation costs between supply and demand points), locomotive fueling problem discussed in this paper is a critical problem in railroad operations. Given: the set of yards, the set of trains to operate, the locomotive assignments to trains, and the fuel cost and capacity data; this problem deals with finding the fueling plan for the various trains to minimize the total cost of fueling the locomotives. We describe three different algorithms, two based on greedy method and one using MIP model, that we used to solve this problem and highlight the summary of solutions obtained by each of them for comparisons of these algorithms.

1. Introduction

With many modes of transport (trucking, rail, and shipping where this option is available) now-a-days there is intense competition in the commodities transport industry, and in order to survive in the business, companies have to keep their charges low. Consequently they have to keep their operating costs low.

About 75% of transport by railroads in the world is based on diesel locomotives, the remaining 25% is mostly running on electrified track. Almost all the goods transport by rail in the US is powered by diesel locomotives. The situation in Europe is the reverse, where almost all of it is on electrified track. This case study deals with minimizing the fuel costs in goods transport powered by diesel locomotives. One of the major components in the operating cost of diesel powered rail transport industry is the cost of fuel. This case study deals with minimizing the cost of fuel and the cost of contracting trucks that deliver the fuel to the locomotives used.

The case study is a simplified real-life problem constructed and set up for the “**Problem Solving Competition-2010**” organized by the **Railway Applications Section (RAS)** of INFORMS. The statement of the problem and all the data sets in it can be seen at <http://www.informs-ras.org/problem.htm>. Kamalesh Somanı (Kamalesh_Somanı@CSX.com) of CSX Transportation, and Juan C. Morales (Juan.Morales@BNSF.com) of BNSF Railways contributed to this problem and the data sets in it. The data sets are also given in Appendix.

In this problem, as in most of the countries, diesel cost/gallon varies from yard to yard. We describe 3 different algorithms that we used to solve this problem and highlight the summary of solutions obtained by each of them for comparisons of these algorithms.

2. Brief Description of the problem in the Case Study

The problem deals with $N[=214]$ trains hauled by $L[=214]$ locomotives on a railroad network consisting of $Y[=73]$ yards over a two week planning horizon. Each train is a sequence of yards visited (referred to as **route** in the paper). Each route may be hauled by a different locomotive on different days; the allocation of locomotives to routes is given as data. For hauling each train in this case study, only one locomotive is used. Each locomotive may haul different trains on different days.

All the routes operated in the case study problem can be grouped into set of pairs, each pair operating between a pair of yards in the forward and reverse directions; but the set of yards visited in the two directions for a route-pair may be different. Every route pair has a dedicated pair of locomotives operating it.

For refueling of its locomotives, each train can stop at any of the yards on its route except the destination yard, but the total number of refuelings on any route should be ≤ 2 . All locomotives have the same fuel capacity of 4500 gallons; and the fuel consumption (3.5 gallons of fuel per mile) on any route is independent of the route and the locomotive operating the train. Fuel consumption for a locomotive travelling between any two yards can be determined using the given table of inter-yard distances. Fuel cost at different yards varies between \$ 2.16 to \$3.52/gallon. Each refueling incurs a setup cost of \$250. Fuel is dispensed by fuelling trucks positioned at yards, each having a maximum capacity of 25000 gallons/day and involving contracting cost of \$8000. The problem statement allows each locomotive

to start on the very first trip with any feasible amount of fuel without any cost incurred; the locomotive should be left with the same amount of fuel after completing the last trip in the planning horizon.

Desired Outputs

We need to determine: (a) which yards will serve as fuelling points for the locomotives(these yards, where refueling trucks are contracted are called “**committed yards**” in this paper), (b) which yard will be used to refuel the locomotive hauling each train, (c) the days and the amount of fuel loaded at each yard used as refueling point for each train, (d) the number of fueling trucks contracted at each yard, (e) and the amount of fuel(in gallons) in each locomotive tank at the beginning of the planning horizon. We need to minimize the total cost = fuel costs+ fueling truck contracting costs+ setup costs for refueling.

3 Discussion on methods used for solving this problem

Typically when faced with a problem like this, OR specialists will try to build a mathematical model for it (the appropriate model for this problem will be an MIP (mixed integer programming) model). For solving an MIP model, the company needs to have access to a software package like CPLEX, and that many railroad companies may not have access to such packages.

So we started looking for an approach which is much simpler to solve the case study problem, which gives comparable results and scales up easily to problems of the size encountered in real world applications. However, for the sake of comparison, we developed a mathematical model for this case study problem and solved it using CPLEX. We discuss this model and the results from it in Section 6.

We then developed a greedy algorithm for the LFP, which meets all these requirements (see [1] for a description of greedy methods). The first step in developing a greedy method for solving this problem is to develop a “**greediness criterion**” for the decisions to be made in it. Keeping the objective function to be minimized in the problem in mind, there are two greediness criteria that we can use for selecting yard i as a refueling yard for a route:

$GC1_p$ = fuel cost incurred at yard p for the route, if yard p is selected as a refueling yard

$GC2_p = (\text{fuel cost incurred at yard } p \text{ for the route}) + (\text{incremental truck contracting cost at this stage, if yard } p \text{ is selected as a refueling yard for this route})$

In the following section, we will discuss the greedy algorithm developed for the problem based on GC1.

4. Description of the greedy algorithm, Algorithm1, using GC1 as the greediness criterion

The decisions in this algorithm are made in the specific order given below, one route at a time.

i. Partitioning the set of routes into various labeled categories

There are several pairs of yards $\{y_i, y_j\}$ such that (y_i, y_j) and (y_j, y_i) are both routes and this pair of routes are operated by a pair of locomotives dedicated to these routes only, each locomotive hauling one of these pairs alternately on alternate days. Route pairs of this type are classified into a set or **category** labeled R_1 . The set R_2 consists of the remaining routes.

R_1 is again partitioned into R_{11} (for these, full locomotive tank capacity is insufficient to cover the round-trip distance from origin to destination and back), R_{12} (for these a full locomotive tank capacity is sufficient to cover the round-trip distance from origin to destination and back). In the case study problem, $R_{11}=\emptyset$, R_{12} contains 59% of all the routes with 33% of all the mileage in the problem.

R_2 consists of route pairs, with at least one stop at an intermediate yard in the forward or reverse direction or both, each operated by a dedicated pair of locomotives hauling in each direction alternately. R_2 is again partitioned into R_{21} (for these, a full locomotive tank capacity is sufficient to cover the entire round trip pair; this contains 28% of all the routes covering 33% of all the mileage in the problem), and R_{22} are the remaining (in each route pair here, at least one refueling is needed in each direction; this set contains 12% of all the routes covering 34% of all the mileage in the problem).

Therefore we will adopt the policy of refueling locomotives serving routes in categories R12 and R21 at most once in each round trip pair of routes and those in categories R11 and R22 at least once on each origin to destination route in this category.

ii. Identifying refueling yards for routes in each Category in Algorithm1

Here we discuss how this method selects the refueling yards to be used on each route; but not the actual refueling plan for each locomotive which will be discussed in sub-section (iv). Clearly each route in $R_1 = R_{12}$ in the case study problem can only be refueled on any day at the origin yard of route hauled on that day, if we choose to refuel it on that day. Also, each locomotive on these routes in R_{12} need not be refueled every day. We will now discuss how the refueling yards on each route in this algorithm, for each category of yards separately.

Category R_{11} : For the routes belonging to set R_{11} in a general problem, there is no choice other than to refuel the locomotive at the origin yards of all trains hauled over the planning horizon on these routes. Thus the origin yards of all routes in set R_{11} will be refueling yards and refueling trucks are committed to be positioned at these yards.

Category R'_{12} : Initially define current $R'_{12} = R_{12}$, S'_{12} = set of origin yards for routes in R'_{12} and Y'_{12} = yard with the cheapest fuel cost among those in S'_{12} . For each route in R'_{12} for which Y'_{12} is the origin yard, fix Y'_{12} as the committed refueling yard, and delete those routes from the set R'_{12} . If R'_{12} is now \emptyset , go to the next category. Otherwise update S'_{12} , Y'_{12} using the current R'_{12} and repeat this step.

Category R_{21} : For each route pair in this category, on every route if there are no previously committed yards amongst the set of yards visited by it, the yard having the cheapest fueling cost on it will be fixed as the committed refueling yard. If there is a committed yard Y_k on this route-pair (i.e. the yard Y_k has been committed as a refueling yard earlier) and if Y_k has the cheapest fuel cost on this route, then commit this yard Y_k as the refueling yard for the route pair. On the other hand, if the cheapest fuel cost yard on this route-pair is Y_p not in the committed list, compute s_{kp} = saving in fuel cost by fueling this route-pair at Y_p rather than Y_k , = (fuel cost at yard Y_k - fuel cost at yard Y_p) x (fuel requirement for the roundtrip route pair). If $s_{kp} \leq 8000$, which is the total truck contracting cost, then this route will be fueled at the previously committed fuel station Y_k . Else it will be refueled at the yard Y_p which will now be added to the committed refueling yard list. This procedure is repeated for all category R_{21} route-pairs.

Category R_{22} : In each of the route pairs in this set, at least one refueling is needed in each direction.

Fact 1 : It turns out that one refueling in each direction is sufficient in the case study problem, hence greedy method selects just one refueling yard in each direction of the route pairs.

We check the following for each pair of yards $\{y_i, y_k\}$ where y_i, y_k belong to different direction routes in this pair. If the mileage of the route from y_i to y_k or y_k to y_i is greater than what can be covered by one locomotive tank capacity, discard this pair. If the mileage of the portion of the route pair from y_i to y_k , or y_k to y_i can both be covered by one locomotive tank capacity, then call this pair of yards as a **feasible pair** (Fact 1 implies that there will be at least one feasible pair of yards), and compute $f_{ik} = (\text{fuel consumption on the portion of the route-pair from } y_i \text{ to } y_k)(\text{cost of fuel per gallon at } y_k) + (\text{fuel consumption on the portion of the route-pair from } y_k \text{ to } y_i)(\text{cost of fuel per gallon at } y_i)$. Among all feasible pairs $\{y_i, y_k\}$, choose that pair corresponding to the lowest value of f_{ik} as the pair of committed refueling yards for the route-pair under consideration. This procedure is repeated for all category R_{22} route-pairs.

iii. Determining initial fuel FI, at origin yards for routes, in Algorithm1

If the originating yard for the route at the beginning of the planning cycle is a committed yard, the initial fuel FI at it is zero. If the originating yard for the route at the beginning of the planning cycle is not a committed yard, the initial fuel FI at it is the fuel required to reach the first committed refueling yard on it from the origin.

iv. Fueling Plan of Locomotives & Number of trucks contracted at Committed Yards in Algorithm1

Once a setup cost for refueling the locomotive is incurred, the greedy method tries to take the full advantage of it by filling the locomotive to full capacity. This principle helps us to determine the fuel loaded at each refueling stop of each locomotive.

So fill up the locomotive tank at the first refueling yard on the route, to the full capacity of the locomotive fuel tank. At subsequent committed refueling yards on this route, refuel to the full capacity of the locomotive fuel tank for Category R_{11} and R_{22} routes. For category R_{12} and R_{21} routes, refuel to full tank capacity at every $\left\lceil \frac{\text{Locomotive tank capacity}}{(\text{fuel consumption rate in gallons per mile})(\text{round trip mileage})} \right\rceil$ round trips.

At the last refueling yard in the planning horizon, refuel only to the extent that a balance fuel equal to the initial amount of fuel, F_I for this route, is left in the locomotive fuel tank.

Using the fueling plan obtained above and the given information on yards visited on each route on each day of the planning horizon, the fuel dispensed at each committed yard on each day of the planning horizon is computed. The number of fueling trucks contracted at any committed yard y_i is determined by the formula $\left\lceil \frac{p_i}{q} \right\rceil$, where p_i is the maximum of the daily fuel dispensed at the committed yard y_i obtained in the above procedure, and $q = 25000$ gallons is the maximum capacity of each fueling truck.

4.1 Highlights of solution obtained by Algorithm1

The solution consists of 36 committed refueling yards and total number of trucks contracted at them is 44 (number of contracted trucks varies from 1 to 3 at different committed yards). The total cost in the solution is \$11.42 million, of which the cost of fuel is \$10.75 million, operating costs of fueling trucks is \$0.35 million and fueling setup cost is \$0.32 million. The utilization of the fueling trucks over the planning horizon varies from a minimum of 3% to 60%. Algorithm1 was coded on C language, which takes about 0.5 seconds for compiling and solution on a 1.6 GHz computer.

Considering the mileage of each route, and the lowest fuel cost of the yards visited on each route, the total fuel cost in any solution is guaranteed to be $\geq \$10.7$ million. The total fuel cost in the solution obtained in Algorithm1 is \$10.75 million. The fuel cost is 94% of the total cost in our solution. From this we can conclude that the solution obtained by Algorithm1 is nearly optimal.

5. Description of the greedy algorithm, Algorithm2, using GC2 as the greediness criterion

Partitioning of set of routes into various categories of routes is the same as in Algorithm1, Section 4.

This algorithm differs from Algorithm1 of Section 4 in the greediness criterion used for selecting refueling yards for various routes. Also in this algorithm, in contrast to Algorithm1, since the selection of the refueling yard on each route is based on the greediness criterion GC2, it requires determining the amount of fuel to be dispensed at each yard on each day of

the planning horizon, on that route before the selection can be made. In Algorithm2 also, refueling yards are selected for routes one at a time sequentially, in the order R_{11} , R_{12} , R_{21} and R_{22} .

At any stage, let T denote the set of committed refueling yards selected upto that stage. For Category R_{11} the procedure for selection of refueling yards for routes is the same as in Algorithm1. Since the locomotive has to be refueled to full capacity at the origin yard of each route in R_{11} , T will be the set of all yards on routes in R_{11} . Then prepare a two-way table G of fuel requirements at yards y in T on day $j \in \{1, \dots, 14\}$ in the planning horizon, where entry g_{yj} in this table is the fuel dispensed at y on day j for the routes processed already. Prepare a new column $H = (h(y))$: $y \in \{1, 2, \dots, 74\} = \text{set of all yards}$ where the entry $h(y) = \text{cost of all fuel dispensed at this yard upto this stage} + \text{cost of contracting fuel trucks needed at this yard to dispense this fuel}$.

For Category R_{12} , order the route pairs in it in decreasing order of round-trip mileage; we will process the routes in this order.

We will select the refueling yard for each route r in R_{12} by the following procedure. For each of the terminal yards y on this route, define $h_2(y) = \text{the fuel + truck contracting cost of dispensing all the fuel commitments at this yard } y \text{ in routes processed already} + \text{this additional route } y$. Choose the yard y in P corresponding to the minimum value of $h_2(y)$ as the refueling yard for this route and update the column H and set T accordingly.

A similar principle is used in processing routes in R_{21} , R_{22} .

Highlights of solution obtained by Algorithm2: The solution consists of 33 committed refueling yards and total number of trucks contracted at them is 39 (number of contracted trucks varies from 1 to 3 at different committed yards). The total cost in the solution is \$11.6 million, of which the cost of fuel is \$10.96 million, operating costs of fueling trucks is \$0.31 million, and fueling setup cost is \$0.35 million. The utilization of the fueling trucks over the planning horizon varies from a minimum of 3% to 80%. Algorithm2 was coded on C language, which takes about 1.5 seconds for compiling and solution on a 1.6 GHz computer.

6. The Mixed Integer Programming (MIP) Model for the case study problem, and its solution obtained used CPLEX software

There are many different ways to model this problem using an MIP model. The main decisions to be made in this problem are: the set of yards which will serve as refueling yards, the yard(s) where each locomotive will refuel, the days on which this refueling will take place and the quantity of fuel loaded at each refueling, and the number of fuel trucks contracted at each refueling station. The problem of making all these decisions to minimize the total cost = fuel cost + setup costs for refuelings + truck contracting costs can be modeled as a MIP (mixed integer programming) model, but it leads to a model with many 0-1 variables, and may take a long time to solve.

The MIP model can be simplified by using the partition of the 214 routes for the trains into the three categories R_{12} , R_{21} and R_{22} discussed above; and using the information: each locomotive serving the routes in category R_{12} needs to be refueled only periodically as discussed in the previous section, that each locomotive serving routes in category R_{21} needs to be refueled only once on each round trip, that each locomotive serving routes in the category R_{22} needs to be refueled only once in each direction of each roundtrip, and that each locomotive is filled to capacity at each refueling. Also we notice that the fuel cost is the major element in the total cost; and all the other costs put together are only a small fraction of the fuel cost. If we take the fuel cost as the objective function to minimize, the model becomes even much simpler.

Here is the MIP model for the simplified version of the problem. In the following when we talk about “refueling on a route p”, it refers to “refueling of a locomotive serving route p”. Since each route pair is served by a unique pair of locomotives, given the planning horizon of 14 days, we conclude that both locomotives serving any route pair, will log equal distance by the end.

Indices used:

p: index used for routes, p=1 to 214

j: index used for yards, j =1 to 73

k: index used for routes in the forward or reverse direction between a pair of terminal yards for trains in R_{22} category, k=1,2

Notation for data elements:

S_p : set of yards on route p

c_j : fuel cost at yard j in terms of \$/mile= (\$/gallon)(3.5 gallons/mile)

m_p : total distance covered by route serving p in entire 2-week planning horizon

Decision Variables: All the decision variables are binary:

$$y_{12pj} = \begin{cases} 1, & \text{if refuelling for category } R_{12} \text{ route } p \text{ is carried out at yard } j \\ 0, & \text{otherwise} \end{cases}$$

$$y_{21pj} = \begin{cases} 1, & \text{if refuelling for category } R_{21} \text{ route } p \text{ is carried out at yard } j \\ 0, & \text{otherwise} \end{cases}$$

$$y_{22_{pj}} = \begin{cases} 1, & \text{if refuelling for category } R_{22} \text{ route } p \text{ in direction } k \text{ is carried out at feasible yard } j \\ 0, & \text{otherwise} \end{cases}$$

$$y_{pj} = \begin{cases} 1, & \text{if the } j\text{th feasible yard refuels category } R_{22} \text{ route } p \\ 0, & \text{otherwise} \end{cases}$$

$$x_j = \begin{cases} 1, & \text{if refuelling trucks are committed at yard } j \\ 0, & \text{otherwise} \end{cases}$$

The Objective Function to minimize is:

$$\text{Minimize } \sum_{p \in R_{12}, j \in S_p} y_{12_{pj}} c_j m_p + \sum_{p \in R_{21}, j \in S_p} y_{21_{pj}} c_j m_p + \sum_{p \in R_{22}, j \in S_p} \sum_{k=1}^2 (y_{22_{pj}} c_j) m_p$$

Subject to the Constraints:

- (1) $\sum_{j \in S_p} y_{12_{pj}} = 1, \text{ for all } p \in R_{12}$
- (2) $\sum_{j \in S_p} x_j \geq 1, \text{ for all } p \in R_{12}$
- (3) $y_{12_{pj}} \leq x_j, \text{ for all } p \in R_{12}, j \in S_p$
- (4) $\sum_{j \in S_p} y_{21_{pj}} = 1, \text{ for all } p \in R_{21}$
- (5) $\sum_{j \in S_p} x_j \geq 1, \text{ for all } p \in R_{21}$
- (6) $y_{21_{pj}} \leq x_j, \text{ for all } p \in R_{21}, j \in S_p$
- (7) $\sum_{j \in S_p} \sum_{k=1}^2 y_{22_{pj}} = 2, \text{ for all } p \in R_{22}$
- (8) $\sum_{j \in S_p} x_j \geq 2, \text{ for all } p \in R_{22}$
- (9) $y_{22_{pj}} \leq x_j, \text{ for all } p \in R_{22}, j \in S_p, k \in \{1,2\}$
- (10) $\sum_{k=1}^2 y_{22_{pj}} = 2y_{pj}, \text{ for all } p \in R_{22}, j \in S_p$

Explanation of the constraints: Constraints (1),(2) and (3) come from the fact that each locomotive serving on a route in category R_{12} is to be refueled at one of the two terminal nodes between which the locomotive goes back and forth, that refueling trucks are to be committed at that yard for refueling. Constraints (4),(5) and (6) come from the corresponding facts for locomotives serving routes in category R_{21} . Constraint (7) corresponds to the fact that each locomotive serving a route in category R_{22} requires refueling once in each direction of the route. Constraint (8) is similar to earlier constraints (2) and (5); and (9) is similar to (3) and (6). Constraint (10) ensures that for category R_{22} only a feasible pair of yards as defined in Section 4 is chosen as a pair of refueling stations for each route pair in R_{22} .

Highlights of solution obtained by MIP Model: The solution consists of 41 committed refueling yards and total number of trucks contracted at them is 49(number of contracted trucks varies from 1 to 3 at different committed yards). The total cost in the solution is \$11.56 million, of which the cost of fuel is \$10.84 million, operating costs of fueling trucks is \$0.39 million and fueling setup cost is \$0.33 million. Even though the MIP model has the objective of minimizing the total cost of fuel, the objective value at the optimum solution of this model, 10.84 million, is greater than the fuel cost for the solution obtained in Algorithm1. The reason for it is that, the solution in the MIP model maintains only 89,873 gallons of fuel in the beginning and end of the planning model as opposed to the solution in Algorithm1 which maintains 96,247 gallons of fuel in the beginning and end of the planning model.

The utilization of the fueling trucks over the planning horizon varies from a minimum of 3 to 60%. The MIP model takes about 6 seconds for processing and solution on a 1.6 GHz computer.

7. Summary

As we have seen from the results obtained in Sections 5 & 6, the results obtained in the greedy method depend on the greediness criteria used for making the decisions. Here is a summary for comparing all three methods:

	Greedy Method with GC1	Greedy Method with GC2	MIP Model
No. of yards where refueling trucks are committed in the optimal solution	36	33	41
Total no. of trucks contracted in the optimal solution	44	39	49
Total truck contracting cost in the optimal solution(million \$)	0.35	0.31	0.39
Total Fuel Cost in the optimal solution (million \$)	10.75*	10.96	10.84*
Total refueling setup cost in the optimal solution(million \$)	0.32	0.35	0.33

Total cost in the optimal solution (million \$)	11.42	11.6	11.56
---	-------	------	-------

* The reason for difference in fuel costs obtained in the solutions of Algorithm1 and the MIP model is that, the solution in the MIP model maintains only 89,873 gallons of fuel in the beginning and end of the planning model as opposed to the solution in Algorithm1 which maintains 96,247 gallons of fuel in the beginning and end of the planning model.

The solution obtained using Algorithm1 with GC1, is comparable to those obtained from the MIP model, and hence the true optimum solution of the problem. Also Algorithm1 is very simple and easy to implement, and scales directly to large scale problems in real world applications.

In the case study problem, greedy method based on GC1 gives better results than that based on GC2. Since fuel cost is over 94% of the overall costs in the optimal solution, GC1 based on fuel cost as greediness criteria works better than GC2. Also since the case study problem is a realistic example of real world problems, we can expect the similar performance in general in practice.

In real world applications it is very likely that there will be more trains on tracks, and consequently most contracted fueling trucks tend to be used to full capacity; and the difference in the total costs associated with GC1 and the MIP-based technique similar to the one discussed in Section 6 may not be much. The greedy method based on either the greediness criteria GC1 or GC2 are very easy to implement, do not need software packages like CPLEX, and take very little CPU time.

In most real world applications, partitioning the trains into categories like R11, R12, R21, R22 like in the case study example; and identifying sections of the track where the locomotive of the train will undergo refueling possibly based on practical logistic considerations, may in fact be the preferred option of railroad managements. Then, if the company does not have access to an MIP software, the greedy method based on GC1 may be the preferred approach for solving the problem. On the other hand if the company has access to a MIP software, a model like the one in Section 6 can be used to model and solve this problem as explained in Chapter 3 of [2].

Acknowledgement: We thank RAS of INFORMS, and Kamlesh Somani, Juan C Morales for permission to use this problem as a case study problem for this paper and for agreeing to maintain the statement of the problem for future readers at <http://www.informs-ras.org/problem.htm>. This problem specified by the data sets here can be used as a classroom project problem illustrating the usefulness of the greedy method in real world applications.
